

DAY_8_TASK_AEM

-27/03/25

1.MSM, Blueprint, Live Copy, and Rollout

- **Multi-Site Manager (MSM):** AEM's MSM enables efficient management of multiple sites by establishing relationships between similar content across different locales or variations.
- **Blueprint:** A blueprint serves as the master version of a site or page, acting as a source for live copies. Changes made in the blueprint can be propagated to its live copies.
- **Live Copy:** A live copy is a derivative version of a blueprint page/site that inherits its content and structure. Updates from the blueprint can be synchronized with the live copy.
- **Rollout:** Rollout refers to the process of propagating updates from a blueprint to its live copies, ensuring consistent and synchronized content across related sites.

2.Language Copy

- **Language Copy** in Adobe Experience Manager (AEM) helps create multilingual versions of a website, maintaining the original structure while providing localized content for diverse audiences.
- This feature is especially useful for global organizations aiming to cater to region-specific language requirements.

How It Works:

1. **Source Selection:** Select the existing site in its original language.
2. **Target Language:** Define the desired language for the new version.
3. **Translation Integration:** Leverage translation services integrated with AEM to automate the content translation process.
4. **Content Synchronization:** Link the translated content to the original, enabling seamless updates and consistency across versions.
